With your child's help, you can make a list of the things that your child likes to do. This will help you to know what to do when you are with your child.

Tab. II.

1. *Chlorophyll a* (Chl *a*) is the primary photosynthetic pigment in most plants and algae. It is a green pigment that absorbs light energy in the blue and red regions of the visible spectrum.

2. *Chlorophyll b* (Chl *b*) is an accessory pigment found in higher plants and green algae. It absorbs light energy in the blue and orange-red regions and transfers the energy to Chl *a*.

3. *Carotenoids* are a group of pigments that include carotenes and xanthophylls. They absorb light energy in the blue and green regions and transfer the energy to Chl *a*.

4. *Xanthophylls* are a subgroup of carotenoids that include lutein, zeaxanthin, and antheraxanthin. They play a role in photoprotection and energy transfer.

5. *Lutein* is a common xanthophyll found in many plants. It is involved in the xanthophyll cycle, which helps protect the photosynthetic apparatus from damage caused by excess light energy.

6. *Zeaxanthin* is another xanthophyll that is converted from lutein under high light conditions. It also plays a role in photoprotection.

7. *Antheraxanthin* is a xanthophyll that is part of the xanthophyll cycle and is involved in the dissipation of excess light energy as heat.

8. *Anthocyanins* are water-soluble pigments that give plants red, purple, and blue colors. They are not directly involved in photosynthesis but can protect the plant from damage caused by UV light and oxidative stress.

9. *Flavonoids* are a large group of plant pigments that include flavones, flavanones, and flavonols. They are involved in various plant processes, including UV protection and signaling.

10. *Quercetin* is a specific flavonoid found in many plants. It has antioxidant properties and is involved in various biological processes.
